

The technology

MinnFinn® is based on disinfection technology used in the healthcare, medical and biotechnology industry. Unlike other treatments which can cause microbial resistance, MinnFinn® breaks apart the cell walls and membranes of microbes, making it the most effective treatment on the market.

Safe

The active ingredients of MinnFinn® are hydrogen peroxide and peracetic acid, which decomposes naturally into water, oxygen, and vinegar. NeuFinn is used to neutralize vinegar into carbon dioxide and water. All these chemicals are naturally-occurring ingredients that are safe for fish, humans, and the environment, unlike other treatment options using organophosphates (known toxins to animals), or Malachite Green and Formalin (both known carcinogens).

Easy to use

Your MinnFinn® treatment takes only one hour, compared with conventional treatments which can take days to weeks. The treatment is halted by adding NeuFinn, eliminating the need for a water change, and providing a safety net if too much MinnFinn® is applied.

“I feel that the MinnFinn® product is a solid performer. I have used it in a variety of applications, from ectoparasite to bacterial skin disease, and had good response each time. It is easy to use with clear instructions. That’s important since the doctor is not there to apply and neutralize the treatments. I look forward to putting it through more challenges as the cases come in, but have yet to find a situation where it hasn’t done its job.”

- Dr. Jason Sulliban
Aloha Animal Hospital, NV

**There is simply...
NOTHING like it!**

MINNFINN

**The MinnFinn® family of products
Keeping Koi and Goldfish Healthy**
(not for use in food fish)

What are you using to treat external disease on your fish?

To keep fish healthy and reduce mortalities, it is essential to have a rapid and effective treatment for external diseases. But there are few choices to the pond fish owner and many of these can take days to weeks for a response. In that time, fish can die! The limited number of organisms that many other medicines treat, and the difficulty in using them, may also lead to an ineffective treatment and fish death.

What is the solution?

MinnFinn® is an effective, safe and simple treatment for most external disease-causing parasites, fungi, and bacteria, yet it does not have the toxicity that will harm you, your fish or the environment. Quick-acting and easy to use, it will save time and the lives of your fish.

MinnFinn®: the safest, easiest and most effective product to treat your fish!

- Safe – non-toxic ingredients that neutralize into food-grade materials.
- Easy to use – no need to change water; treatments are done in ONE hour.
- Superior efficacy – single product effective against a broad range of microorganisms.
- Compatibility – may be used in combination with salt treatments. Not recommended for use in combination with ANY other treatments.
- Environmentally friendly – decomposed and neutralized into naturally occurring ingredients.
